Day 4: Adding Packages Summary

- You can install `fontawesome` package like this:

```
npm install @fontawesome/fontawesome-free
```

You can also find other packages here: <https://docs.npmjs.com/cli/v8/commands>

- You can find `angular.json` file (Angular's configuration file) in the root folder of the client app.
 - To add a CSS style to all templates of the project you can add the CSS file to the `projects/web/architect/styles` array.
- You can assign anonymous objects to interfaces in Typescript when the object implements the interface.

```
interface TimePlaceRm {  
  place: string;  
  time: string;  
}  
  
var x: TimePlaceRm = {  
  place: 'London',  
  time: Date.now().toString()  
}
```

- You can pass anonymous objects to methods that accept interfaces when the object implements the interface.

```
f(p: TimePlaceRm){  
  ...  
}  
  
f({ place: 'London', time: '...'})
```

-
- Listing items can be using the Angular's builtin NgForOf directive:

```
<div *ngFor="let flight of searchResult">
  {{flight.airline}}
</div>
```
